

EasySend™
10011010101

If your office employees are not worried about connectivity, then why should your mobile workers have to worry about it? Sending data in the field should be as **EASY** as sending an email from your office PC. All too often, mobile applications require the end user to manage connectivity, security and delivery of mobile data. This creates significant user frustration, low technology adoption and a burden on IT resources. EasySend™, from Field2Base, provides Patent protected managed communications technology that makes field communications as easy as office communications.

Once the field user is ready to send data, EasySend™ will automatically search for and connect to the fastest, most reliable form of connectivity (LAN / Wi-Fi / Broadband Cellular) available. EasySend™ will also automatically encrypt the data using 256 bit AES encryption standards. The Field2Base relay manages the connection session and delivers the field user's data to its final destination*. If at any time, the field user's connection is interrupted, EasySend™ will reestablish the connection and resume the transmission thus guaranteeing data delivery.

*See MyData™ product for additional details on data delivery options
